Organization and performance of a two-level virtual-real cache hierarchy W. H. Wang, J.-L. Baer, H. M. Levy

April 1989 ACM SIGARCH Computer Architecture News, Proceedings of the 16th annual international symposium on Computer architecture, Volume 17 Issue 3

Full text available: pdf(1.01 MB)

Additional Information: full citation, abstract, references, citings, index

We propose and analyze a two-level cache organization that provides high memory bandwidth. The first-level cache is accessed directly by virtual addresses. It is small, fast, and, without the burden of address translation, can easily be optimized to match the processor speed. The virtually-addressed cache is backed up by a large physically-addressed cache; this second-level cache provides a high hit ratio and greatly reduces memory traffic. We show how the second-level cache can be easily e ...

² A memory management unit and cache controller for the MARS system Feipei Lai, Chyuan-Yow Wu, Tai-Ming Parng

November 1990 Proceedings of the 23rd annual workshop and symposium on Microprogramming and microarchitecture

Full text available: pdf(1.07 MB)

Additional Information: full citation, abstract, references

For large caches, the interaction between cache access and address translation affects the machine cycle time and the access time to memory. The physically addressed caches slow down the cache access due to the virtual address translation. The virtually addressed caches is faster, but the synonym problem is difficult to handle. By some software constraints and hardware support, our virtually addressed physically tagged caches can achieve the same speed as traditional virtually addressed cac ...

Supporting reference and dirty bits in SPUR's virtual address cache D. A. Wood, R. H. Katz

April 1989 ACM SIGARCH Computer Architecture News, Proceedings of the 16th annual international symposium on Computer architecture, Volume 17 Issue 3

Full text available: pdf(1.12 MB)

Additional Information: full citation, abstract, references, citings, index

Virtual address caches can provide faster access times than physical address caches, because translation is only required on cache misses. However, because we don't check the translation information on each cache access, maintaining reference and dirty bits is more difficult. In this paper we examine the trade-offs in supporting reference and dirty bits in a virtual address cache. We use measurements from a uniprocessor SPUR prototype to evaluate different alternatives. The prototype's buil ...
